

IN THE CLAIMS

Claims 1-9 (cancelled)

1 Claim 10 (currently amended) A hydrogen sensor comprising:

2 (a) a dielectric surface material; and

3 (b) one or more columns of metal nanoparticles on said surface, wherein nanogaps between
4 the nanoparticles close when exposed to a threshold hydrogen concentration, wherein closure of said
5 nanogaps effects a detectable electronic response along the column of nanoparticles when said column
6 is incorporated into an electrical circuit, wherein said metal nanoparticles comprise alloys of Pd and
7 Ag, wherein multiple columns of metal nanoparticles comprise varying ratios of Pd and Ag so as to
8 effect the detection of hydrogen over a range of concentrations with the same device.

Claim 11 (cancelled)

1 Claim 12 (currently amended) The hydrogen sensor of claim [[11]] 10, wherein said electrical
2 response is selected from the group consisting of a change in resistivity, a change in conductivity, a
3 change in capacitance, a change in conductivity, and combinations thereof.

1 Claim 13 (currently amended) The hydrogen sensor of claim [[11]] 10, wherein said metal
2 nanoparticles comprise Pd.

Claim 14 (cancelled)

Claim 15 (cancelled)

1 Claim 16 (currently amended) The hydrogen sensor of claim 10, wherein said sensor
2 provides for detection of hydrogen in transformers.

Claims 17-20 (cancelled)
